# State and Provincial Ratio Study Practices: Results of 2008 Survey

# BY THE TECHNICAL STANDARDS COMMITTEE, INTERNATIONAL ASSOCIATION OF ASSESSING OFFICERS

neriodically over the last 20 years, prevalent practices and issues in ratio studies have been explored by comparing U.S. states, Canadian provinces and territories, and a few local jurisdictions in terms of frequency of studies, standards used to evaluate results, and final use of results. Surveys were conducted in 1989, 1992, 1994, 1997, and 2003, and the results reported by Dornfest (1993, 1995, 1997) and Dornfest and Thompson (2004). The latest survey was conducted by the IAAO Technical Standards Committee in 2008. This article discusses responses and some trends since 1989, focusing on the most recent changes, and presents tables showing key findings, tabulated responses and the individual responses from each jurisdiction, questions

altered for the 2008 survey, and methods used for detecting sales chasing.

Note that the 1999 version of the IAAO Standard on Ratio Studies was used as the basis for comparison, because when the survey was conducted in the spring of 2008, the 2007 version of the standard had not been sufficiently exposed for broad adoption by jurisdictions.

### Introduction

Historically, little written material was available to provide a basis for standardization of ratio studies. By the late 1970s, IAAO was providing guidance through materials, including the *Improving Real Property Assessment* textbook. Shortly thereafter, the first IAAO *Standard on* 

The International Association of Assessing Officers (IAAO) Technical Standards Committee develops and maintains technical standards of professional practice in assessment administration, tax policy, and mass appraisal. The committee also provides input into technical assistance programs and projects regarding property tax administration, policy, and valuation of property. Among the committee's recent work was revision of the Standard on Digital Cadastral Maps and Parcel Identifiers (approved April 2009), the Standard on Mass Appraisal of Real Property (approved January 2008), and the Standard on Ratio Studies (adopted July 2007).

Coauthors of this report were committee chair Nancy C. Tomberlin, Ratio Study Coordinator, Property Valuation Division, Kansas Department of Revenue, and committee members Alan S. Dornfest, AAS, Property Tax Policy Supervisor, Idaho State Tax Commission; Bill Marchand, Chief Deputy Assessor, City of Norfolk, Virginia; Joe Hapgood, CAE, Revenue Administrator, Ad Valorem Division, Oklahoma Tax Commission; Peter Davis, Ratio Study/GIS Supervisor, Division of Property Valuation, Kansas Department of Revenue; and Sheldon Bluestein, former Land Records Supervisor, Ada County (ID) Assessor's Office. Director of Publications and Marketing Christopher Bennett participated as IAAO staff liaison. Rick Anderson, tax policy specialist for the Idaho State Tax Commission, performed the data compilation and verification. Ratio Studies was published in 1980. By 1990, the IAAO Property Appraisal and Assessment Administration text and an updated Standard on Ratio Studies were available and in wide circulation. These materials have been updated, and there is now a 2007 version of the Standard on Ratio Studies and a 1999 textbook, Mass Appraisal of Real Property.

Although these materials present many unified themes for ratio study practices, disparities in use and terminology still exist, thus making interpretation of survey responses somewhat subjective. Reports on previous ratio study survey results (Dornfest 1993, 1995, and 1997; Dornfest and Thompson 2004) noted a great deal of confusion about ratio study terminology, techniques, standards, and use. A certain amount of this is probably unavoidable, resulting from longstanding practices and local statutory guidelines, both of which are difficult to change. The committee attempted to address this problem by personal follow-up contacts with many of the participants in the survey.

In addition to exploring U.S. state and Canadian provincial and territorial practices, this survey, because of its continuing nature, makes it possible to report on the incorporation of professionally accepted best practices. Results from this latest survey show a continuation of trends noted in 2003. However, while prior ratio study surveys indicated an increasing number of jurisdictions were adopting major points addressed in the IAAO *Standard on Ratio Studies*, this trend was not apparent when results were compared with those from 2003.

The intent of this analysis is to continue to search for clarification of technical issues by exploring and reviewing state, provincial, and territorial level ratio study practices throughout the United States and Canada. Responses are interpreted in an attempt to provide meaningful comparisons with previous surveys.

Hawaii and Delaware are unique in that they do not provide state oversight

for local assessments. Responses for these states were from local jurisdictions and were either compiled into composite views that incorporate the prevailing practices or reported separately.

## Survey Development and Organization

The 2008 survey is the first to be conducted by the Technical Standards Committee. Prior surveys in the series were conducted by Alan Dornfest, AAS, of the Idaho State Tax Commission, along with staff from his office. Prior to 1989, surveys on ratio studies were conducted by Robert Gloudemans when he was employed by the Arizona Department of Revenue. It is expected that Web tools, which were used for the first time in 2008, will enable the committee to conduct this survey more frequently in the future.

The committee reviewed the format and verbiage used in the 2003 survey. Some of the questions were reordered to better reflect real and personal property distinctions, but the majority of questions were rewritten. The committee attempted to retain the theme of each topic while adding clarity. Although many prior questions were retained to permit longitudinal comparisons, a few areas needed clarification or are of greater importance today and therefore were updated or expanded. After initial development, the draft survey was reviewed by Tim Wooten of the Texas Comptroller's Office.

The current survey was conducted as an online survey over the Web by using the Zoomerang<sup>®</sup> survey tool. Although this greatly facilitated completion, shortened turnaround time, and broadened participation, design limitations in some instances restricted answers for a few questions, which then required additional follow-up for clarification.

An invitation to participate in the survey, along with a printable PDF version of the 104-question survey, was sent via e-mail to designated contacts in the states, provinces, and territories. Respondents were asked to pre-answer the survey questions on a printed version and then go to a link to the IAAO Web site to complete it in one sitting. A text version of the online survey, showing the original questions in their entirety, is provided in Appendix A.

Responses were received from every Canadian province; the Northwest Territory of Canada (the territories of Nunavut and Yukon do not conduct ratio studies); all U.S. states; the of Columbia; and two counties within Hawaii (the counties of Hawaii and Honolulu). Some of the responses did not fit neatly into a particular category and may be shown more than once in the tabulation of responses. This is particularly true when responses for different categories of property are expected to vary, as in coefficient of dispersion (COD) standards for residential, commercial, vacant land, and other types of property. For this reason, the tabulations do not always add to the total number of responses.

# **Survey Limitations**

After reviewing responses and clarifying feedback, the committee noted the following limitations that can affect interpretation of trends among surveys.

• In many cases, the theme of the questions was the same or similar; however, the entire survey was rewritten, and therefore the answers may not exactly correspond. Questions that have been

substantively altered for the 2008 survey are shown in table 1.

- Because the survey did not provide a definition of the terms *base year* and *reliability*, there were various interpretations. Therefore, for consistency in interpreting responses, the following definitions were used:
  - Base year means assessments are uniform as of any year or date prior to the current year (2008). Cyclic assessment systems (e.g., all property reassessed once every five years with no interim adjustment) that tend to be uniform statewide or those in which some jurisdictions make interim adjustments were not considered to be base year assessments.
  - Reliability means use of confidence intervals and similar statistics for testing appraisal level and compliance with standards. States and provinces indicating they judge reliability by use of frequency distributions, coefficient of dispersion (COD), coefficient of variation (COV), and similar statistics were not included as using reliability statistics.

2003 Question Number	2008 Question Number	Summary of Change
7,7b	11–13	Q11 is new in 2008. In 2003, Q7 asked if audits of appraisal procedures were done for any class or category of property. In 2008, Q12 asked about such audits with respect to local assessment practices in general.
		Q13 was more vague in 2003.
16	63	In 2003, the question asked whether any nonagricultural properties were appraised at current market value. In 2008, the question was whether local jurisdictions annually valued categories of property other than agricultural or timberland at current market value. The issue is whether respondents interpret the terms <i>appraised</i> and <i>valued</i> as synonymous.

- Responses have been categorized to indicate state-mandated or statewide-implemented procedures to the extent possible. In some cases it is possible to differentiate between these two possibilities. For example, if a state's laws permit ordering adjustments to locally determined assessments but the state has not utilized this provision, that can be discerned from the answers. However, in the case of reassessment and reappraisal cycles, states have been categorized based on statutory requirements when there are multiple local systems in use (i.e., current market value, base years, regular cycles, and the like).
- The survey questions were reordered in 2008 to better group questions related to real versus personal property. This re-ordering may have resulted in respondents assuming that certain questions related only to real property, when the questions could relate to real or personal property. (See, for example, question 12 [Appendix A] regarding procedural audits.)
- Questions about reliability and confidence intervals were not divided into direct and indirect equalization uses. This diminishes the accuracy of responses to this set of questions when states or provinces used point estimates for one type of equalization but not for another.
- Some questions were expanded to allow additional choices. This shifted the tabulated numeric responses so they may not be directly comparable with previous survey results. (e.g., Appendix B, 2008 question number 8)

# Responses from U.S. States and Canadian Provinces and Territories

New or expanded areas explored with the 2008 survey were as follows:

- Use of adjustments to sale prices distinguished between authority and actual use
- Authority to order reappraisals or to order adjustments to locally determined assessments indicated how often such actions had been taken in the past three years
- Measures of level used for direct equalization distinguished from measures of level used for indirect equalization
- Use of lower limit of COD as indicator of possible sales chasing
- Use of specific outlier trimming procedures identified
- Specific actions taken if level standards are based on confidence intervals, but point estimates continue to be out of compliance for several years
- Existence of nonstatutory requirements to test for sales chasing
- Use of specific techniques to detect sales chasing
- Use of expanded procedural audits.

In addition, the following questions were deleted because the topics were considered to be of limited interest or importance:

- Whether a 90% or a 95% level of confidence was used
- Sample stratification issues
- Legal penalties for failure to disclose correct sales information.

Table 2 is a summary of key findings for U.S. and Canadian responses to major survey issues. Major ratio study practices and trends in states since 1989 can be compared in this table. Trends in Canadian provinces and territories are discernable beginning in 1994. Because of the larger number of Canadian respondents since 1997, comparison with previous provincial surveys may be misleading.

Appendix B presents more detailed tabulations of U.S. and Canadian responses. This

### Table 2. Key findings

Notes

(a) 1994 Canadian survey response rate was 7/12 or 58%.

1997 Canadian survey response rate was 11/12 or 92%.

2003 Canadian survey response rate was 12/13 or 92%.

2008 Canadian survey response rate was 11/13 or 85%.

1989 U.S. survey response rate was 48/51 or 94%.

1992 U.S. survey response rate was 47/51 or 92%.

1994 U.S. survey response rate was 46/51 or 90%.

1997 U.S. survey response rate was 51/51 or 100%, includes District of Columbia plus a composite of 2 of 4 Hawaiian counties. 2003 U.S. survey response rate was 51/51 or 100%, includes District of Columbia plus a composite of all 4 Hawaiian counties. 2008 U.S. survey response rate was 51/51 or 100%, includes District of Columbia plus a composite of 2 of 4 Hawaiian counties.

(b) Two Hawaiian respondents were counted once in some instances and twice in others where applicable.

(c) Includes Colorado and Mississippi which contract out study

(d) The 2008 total reflects addition of Delaware, loss of disclosure in South Carolina, and proper classification of Nevada.

(e) Results correspond to questions 48–52 in 2008 survey.

table allows comparison among responses from the 1994, 1997, and 2003 surveys.

From these tables, it appears that the *typical* ratio study program includes the following features:

- An annual ratio study of real property is conducted by the state, province, or territory.
- Sales or a mix of sales and appraisals of real property is used to develop the ratio study.
- There is statutory authority requiring disclosure of sale prices to administrative jurisdictions by means of mandatory disclosure and transfer fees.
- Adjustments to sale prices are made primarily for personal property included in the sale price and, secondarily, for financing and time.
- U.S. ratio study results are used primarily to equalize funding, advise local officials of assessment conditions, and determine the need for reappraisal
  - Secondary uses are adjusting locally determined values, equalizing assessments of centrally assessed properties, and approving tax rolls.

Canadian results are used primarily in an advisory capacity.

- Level and uniformity standards are used for gauging performance or compliance; these are often similar to IAAO ratio study standards.
- Results are calculated on the basis of samples for which there is generally no predetermined minimum size.
- Reliability is tested frequently, and, in some cases, confidence intervals are used to determine compliance with standards or other requirements.

Detailed responses received from each U.S. state are found in appendix C and from each Canadian province or territory in appendix D. These tables provide a complete rendition of the responses, except where it became evident from the responses that the wording of a few questions may have caused confusion. In these few instances, the responses are judged as not meaningful and are not reported in the tables.

Detailed counts from the newly expanded questions about methods used to detect sales chasing are provided in appendix E.

# **Recent Trends—United States**

Within the limitations already noted, the questions in the 2008 survey and the respondents are similar to those in previous ratio study surveys. While respecting the constraints and other concerns noted, it is often possible to compare changes in U.S. ratio study practices over time.

#### **General Trends**

The number of states performing annual ratio studies increased from 41 in 2003 to 44 in 2008. Although many states combine sales and appraisals, there appears to be a continuing tendency toward the use of sales only. This tendency may be related to resources needed for high-quality appraisals that are USPAPcompliant, a requirement that had not been specified in IAAO standards prior to 1999. Only California still bases its ratio study exclusively on appraisals. In this state, the close ties between sale price and assessed value reduce the applicability of traditional sales-based studies.

While the number of states performing personal property ratio studies increased from six to ten from 1989 to 1992, this indicator has been steadily decreasing. Only six states are performing ratio studies on personal property in 2008, and these studies are based solely on appraisals. A large number of states are now conducting procedure audits. Because of the rewording of this series of questions, it appears that very few states conduct such audits in lieu of ratio studies, but more states are using procedural audits of local assessment practices.

Such studies typically are performed to provide information about selected property categories for which there is little market activity or when use value and other constraints not directly related to the market are in place. The results of procedural audits can be used to determine compliance.

#### **Disclosure of Sale Price**

There are three means of disclosure: full mandatory sale price disclosure, transfer fees, and mandatory recordation of any transfer instrument. Seven states do not have any means of disclosure as statewide policy: Alaska, Idaho, Louisiana, Mississippi, Missouri, Texas, and Utah. However, the limitation is not as severe in Missouri because several major local jurisdictions have full disclosure, so only parts of the state are without sale price disclosure requirements.

Many states have transfer taxes based on sale price; some of these states also have full disclosure. Since 2003, Delaware has gained disclosure requirements and has been added to this list. Nevada and South Carolina lost disclosure requirements but retained transfer taxes related to sale price.

Disclosure typically occurs when a sale price statement is filed as deeds are processed. More states indicated that disclosed sale prices are confidential; this number increased from five in 2003 to nine in 2008.

#### **Intangible Property**

The number of states reporting intangibles as exempt continued to increase. There were 25 states reporting such a statutory exemption in 1994, 32 in 1997, 37 in 2003, and 40 in 2008. Appendix B delineates the number of states exempting various specific intangibles.

#### **Adjustments to Sales Prices**

An increasing number of states are adjusting sale prices, particularly for time, personal property, and intangibles.

As in 1997 and 2003, three states still use overall adjustments. Of these, only two, Florida and Arizona, make significant overall adjustments and the substance of these has not changed for many years. Washington makes a nominal 1% adjustment for personal property presumed to be included in each sale price.

#### **Use of Ratio Studies**

The ratio study has traditionally been used in an *advise and assist* role. In 2008, there was a small reduction in the number of states using ratio studies for advisory purposes and a significant reduction in the number using ratio studies to assist mass appraisal programs. The number of states indicating other major uses tended to decrease slightly.

Twenty states can order adjustments to locally determined assessed values. There was some increase in the number of these that can order adjustments by class or category of property. However, only 16 actually issued any adjustment orders during the last three years. Previous surveys showed the number of states that would apply trends to individual categories of property has varied considerably over time.

The pattern of states indicating use of a grace period before ordering adjustments has fluctuated since 1994.

Of the 28 states that have authority to use ratio studies to order reappraisal, only 20 actually did so in the last three years.

#### **Uniformity Standards**

The number of states adopting uniformity standards has leveled since 2003. All but 12 states now have such standards. As in 2003, 23 states have established standards similar to those recommended by the 1999 IAAO *Standard on Ratio Studies*. General uniformity standards are based predominantly on COD.

The number of states that have developed price-related differential (PRD) standards has continued to increase, with 27 states using these standards in 2008. It is noteworthy that the number of states using the specific guidelines in the IAAO *Standard on Ratio Studies* has continued to increase, with 23 states using this standard in 2008.

Thirty states can initiate action on the basis of poor uniformity. The most typical action is ordering reappraisal, which can be done in 23 of these states.

Twenty-one states test the reliability of the COD. Fourteen test the reliability of the PRD. Eleven states take reliability into account when making decisions or determining compliance with uniformity standards.

#### Level Standards

A level standard is defined as some range of acceptability around the statutorily required assessment ratio. Such ranges can be provided by statute but more frequently are established by administrative or oversight agency authority. Many states have established ranges of this type, but the number of states with no allowable variance standard for assessment level has decreased slightly, to 15 in 2008. The IAAO Standard on Ratio Studies recommends ±10% for direct equalization of locally determined values and ±5% for indirect equalization of funding distributions. The number of states using the  $\pm 10\%$  parameter remained at 16, while the number using  $\pm 5\%$  decreased to 4 in 2008.

# Reliability

Employing the principles of statistical sampling error, ratio studies tend to be more reliable when large, uniform samples are used and less reliable when these conditions are not met. The number of states testing reliability and using this information for compliance purposes appears to have decreased in 2008. However, there was considerable confusion about this concept, and it is not clear whether long-term comparisons are valid.

The 2008 survey examined two special situations in which lower levels of confidence or point estimates might be appropriate, as described in the IAAO Standard on Ratio Studies. In the first scenario, the survey asked whether a decision based on reliability statistics could be based on point estimates or lower levels of confidence given longstanding noncomplying point estimates. Three states indicated they would lower levels of confidence in this situation. No state currently using confidence intervals would substitute point estimates. For the second scenario, the survey asked whether the response would change if the COD also showed poor uniformity. In this case, 3 states would use lower levels of confidence, but 20 states would substitute point estimates. The 1999 Standard on Ratio Studies recommends such lower degrees of confidence "when independent samples show long-term appraisal inequity as evidenced by poor level and uniformity statistics for at least three consecutive years ....."

#### **Market Value**

While it appears the number of states appraising non-agricultural property at current market value has increased, with 32 states reporting this system for 2008, this question was reworded; hence, comparison with responses in previous surveys is questionable. Some states appraise nonagricultural property at current market value, but have fractional assessment ratios to determine taxable value. This distinction must be taken into account when comparing 2003 with 2008 responses. For example, for residential property, 26 states appraise at market value and do not use fractional assessment ratios below 100%. Some states set market value as an appraisal goal but restrict the meaning of this term somewhat by establishing base years. Typically, a base year represents the point in time when an assessment is frozen or subject to limited increases. The number of states using a base year decreased slightly, to 10 in 2008.

The number of states adjusting values during interim years between reappraisals decreased from 14 to 6. States with uniform assessment cycles (e.g., all property is assessed at market value once every four years) in which appraisals are to reflect 100% of market value when property reaches its reassessment time in the cycle were included as assessing at 100% of market value. In such cyclic systems, this will not be true of all property each year.

#### Measures of Assessment Level

States typically compute three measures of level: the mean, the median, and the weighted mean. Although these statistics are computed by similar numbers of states, either the median or weighted mean predominates for equalization purposes.

The 2008 survey further differentiated between statistics used for direct and indirect equalization. The median is the dominant statistic used for direct equalization, with 25 states using this measure, while the weighted mean is used by a few more states than the median for indirect equalization (15 states versus 12 states, respectively). The 1999 *Standard on Ratio Studies* differentiates between direct (parcels) and indirect (funding) equalization, suggesting that the median is more appropriate for the former and the weighted mean for the latter.

## Outliers

The number of states identifying outliers was similar in 2003 and 2008. In 2008, the survey was expanded to explore methods of outlier identification. Despite considerable treatment of this subject in the *Standard on Ratio Studies*, no particular method prevails in practice.

## Sales Chasing

In 2008, 27 states reviewed samples to determine whether sales chasing was

distorting results. This question was expanded in 2008 to enable states to indicate which technique was most often used to identify potential sales chasing. The most commonly used technique is comparison of average value changes on sold and unsold parcels. Nebraska establishes a lower limit on the COD as a possible indicator of sales chasing. A detailed report of the preferred techniques states use to detect sales chasing is presented in appendix E.

## Sample Size and Representativeness

Uncertainty continues about the minimum sample size standard that should be used to evaluate assessment performance based on a ratio study. There is considerable variance among jurisdictions and no significant change from 2003 to 2008.

The number of states testing samples for representativeness decreased from 32 in 2003 to 21 in 2008. Stratification questions were deleted for the 2008 survey.

### Legal Action

Fewer states indicated that a ratio study could result in outside legal action. Although 37 states in 2003 indicated this could occur, only 28 states indicated this was a possibility in 2008.

# **Recent Trends—Canada**

The 2008 survey includes responses from all Canadian provinces and the Northwest Territories. Except for the Yukon Territory, which did not respond in 2008, the same provinces and territories responded as in 2003. There were fewer responding in 1994, making comparisons with that year difficult. In a few cases, significant trends are apparent and are stated. In other cases, the general nature of Canadian ratio studies is discussed and some comparison with U.S. practices is offered.

#### General

The number of provinces or territories performing annual ratio studies has remained unchanged at eight since 2003. However, in an increasing number of provinces or territories, the ratio study is performed at the provincial or territorial level, rather than by local jurisdictions.

As in 2003, only one province, Alberta, adds appraisals to sales samples. In 2003, Northwest Territories indicated it relied strictly on appraisals for its ratio study. This jurisdiction has now switched to using sales only, so there no longer are any Canadian provinces or territories using appraisals only.

Personal property is exempt in all but two provinces. None of the provinces performs personal property ratio studies.

Procedural audits are used by six provinces, but they substitute for ratio studies only in the Northwest Territories.

#### **Disclosure of Sale Price**

All 11 of the responding jurisdictions have full disclosure as well as transfer fees. In 2003, all but the Yukon Territory, which did not respond in 2008, had full disclosure.

#### **Intangible Property**

The number of provinces and territories reporting a statutory exemption for intangible personal property decreased from six in 2003 to three in 2008.

#### **Adjustments to Sales Prices**

Adjustments for time, personal property, and financing are the most common and appear at about the same relative frequency as in the United States. No Canadian jurisdiction makes overall adjustments at this time.

#### Use of Ratio Studies

The predominant use of ratio studies is as a tool to advise local jurisdictions or to assist mass appraisal programs. Only one province (New Brunswick) uses its ratio study to adjust locally determined values, and in two provinces, it can be used to equalize funding. No province uses the study to order reappraisal, although Saskatchewan indicated this use in 2003. As has been the case since 1997, none uses the study to adjust utility (centrally assessed) values. Regardless of authority, no province has actually ordered adjustments to locally determined values or ordered reappraisal in the past three years.

#### Standards—Level and Uniformity

Use of uniformity standards is similar to that reported in 2003, with eight provinces using such standards. Most of the reporting provinces use standards similar to those found in the IAAO *Standard on Ratio Studies*.

Six provinces continue to report use of PRD standards, and five of these cite the range found in the IAAO *Standard on Ratio Studies*.

Five provinces can initiate action based on uniformity. This number is down from seven reporting such a possibility in both 1997 and 2003.

The number of provinces using allowable variance ranges for assessment level grew from five in 2003 to eight in 2008. Three of these provinces use a  $\pm 10\%$ range for this purpose, while only one used this range in 2003. Two continue to use a tighter  $\pm 5\%$  range.

#### Reliability

In five provinces, confidence intervals are computed and could influence a determination of compliance with assessment level standards. Five provinces can review level measures or use additional information to make decisions if the COD indicates poor uniformity. In the Northwest Territories, compliance could be based on point estimates if attainment has been based only on confidence intervals for several years.

The number of provinces testing the reliability of the COD and PRD increased from four and two in 2003 to five and four, respectively, in 2008.

## Market Value

Although full value assessment had been more prevalent in Canada than in the United States, the number of provinces reporting annually updated current residential market value decreased from 2003 to 2008 (from eight in 2003 to four in 2008). During the same period, the number reporting use of base years increased (six in 2008 versus five in 2003).

### Measures of Assessment Level

Canadian use of the various measures of assessment level is similar to that in the United States. However, no Canadian province uses the weighted mean for equalization, while two used this statistic in 2003. Five provinces test normality of the data distribution.

## Outliers

Seven provinces test for outliers; this is a decrease from nine in 2003. Two provinces place limits on the number of sales that can be trimmed.

# Sales Chasing

No province has statutes requiring testing for sales chasing. Two provinces (Alberta and Newfoundland) use the comparison of average value change technique to test for sales chasing. Additional details on sales-chasing detection methods are provided in appendix E.

## Sample Size and Representativeness

Sample size quotas are used only by Prince Edward Island Province. Minimum sample size requirements generally are similar to those in the United States. Four provinces test samples for representativeness.

# Legal Action

Only in Alberta can legal action be taken as a result of ratio studies.

# Conclusions

Ratio studies remain critical ways for measuring, evaluating, and working toward the improvement of assessment practices in most places. A degree of order in the development and use of these studies has been brought about by the use and availability of the IAAO *Standard on Ratio Studies.* However, aside from isolated instances, there does not appear to be any clear continuing trend for states and provinces to adopt more features of this IAAO standard.

The report on the 2003 ratio study survey indicated that a growing number of states and provinces were basing assessment level compliance on confidence intervals and suggested that a major change in practice related to this issue was emerging. However, such a trend is not supported by the results of the 2008 survey, which shows similar or diminishing numbers of jurisdictions using reliability tests in such decision making. Even more troubling, inconsistencies among answers to multiple questions on this subject lead this committee to conclude that the degree of understanding of statistical reliability measures is deficient. We now believe that previous conclusions on trends of use of such statistics may have been dubious at best. As a corollary in support of this conclusion, few states and provinces or territories appear to have responded to the recommendation first found in the 1999 Standard on Ratio Studies to lower the level of confidence when long-term inequities are apparent. The lack of response in this area suggests a lack of understanding of the underlying statistical measures.

On a more positive note, many states and some provinces are using the methods outlined in the IAAO standard for identifying outliers and for detecting sales chasing. Even the observed versus expected distribution of ratios test, first introduced in the 1999 standard, is being used and is the method of first choice by six states. In future surveys, follow-up questions could explore issues of resolution once sales chasing is identified.

The 1999 IAAO Standard on Ratio Studies continues the tradition of providing valuable guidance and assistance and is widely cited and used. It is hoped this survey will provide focus for U.S. states and for Canadian provinces and territories attempting to evaluate their ratio study systems and work toward internationally recognized guidelines. It is also hoped states will use the survey results as an impetus to become more knowledgeable about technical aspects of ratio studies they have not yet incorporated into their practices.

# Authors Note

The survey questionnaire and the detailed compilations of survey results found in the appendix are available online at the IAAO Web site, www.iaao. org, in the Topics of Interest area.

# Appendix A. 2008 Ratio Study Practices Questionnaire

**Q1: Enter your full contact information.** Name/Title/Jurisdiction/Agency name/ Country/E-mail address/Phone

**Q2: What is your jurisdiction type?**  $\Box$  State agency  $\Box$  Provincial agency  $\Box$  Territory  $\Box$  Local  $\Box$  Other, describe (50 char. limit):

**Q3: How often is your jurisdiction required to conduct ratio studies?** Indicate if annual or explain other variations.

**Q4: Who conducts your ratio study? (check all that apply)**  $\Box$  State/province/territory officials  $\Box$  Local officials  $\Box$  Contracted service provider (university or private company)  $\Box$  Other, specify (50 char. limit):

**Q5:** Which of the following does your real property ratio study include?  $\Box$  Sales only  $\Box$  Independent appraisals only  $\Box$  Both sales and independent appraisals

**Q6:** If you use both sales and independent appraisals, can they be combined in order to study one type or category of property?  $\Box$  No  $\Box$  Yes, comments (50 char. limit):

**Q7:** If sales are used in the ratio study, which jurisdiction performs the sample selection?  $\Box$  State or province  $\Box$  Local  $\Box$  Both  $\Box$  Other, specify (50 char. limit):

**Q8: Which jurisdiction conducts the sales validation (screening)?**  $\Box$  State/provincial agency  $\Box$  Local  $\Box$  Contracted service provider  $\Box$  Other, specify (50 char. limit):

Q9: If the state/provincial agency does NOT conduct the sales validation, does the agency perform an audit of the sales validation process?  $\rm Yes/No$ 

Q10: If an audit of sales is performed by the oversight agency, briefly summarize your audit policy:

Q12: If your agency performs a procedural audit of local assessment procedures/ practices, is the audit used INSTEAD OF a ratio study? Yes/No Additional comment:

Q13: If your agency performs a procedural audit of local assessment procedures/ practices, is it used IN ADDITION TO ratio study information? Yes/No

**Q14: If your agency performs a procedural audit of local assessment procedures**/ practices, is it used SOLELY to advise or assist local appraisal offices? Yes/No Additional comment:

**Q15:** Can equalization or a reappraisal be ordered as a result of such audits?  $\Box$  No  $\Box$  Yes, describe authorized actions (50 char. limit):

**Q16:** Regarding sales price disclosure: Does your jurisdiction have a law requiring disclosure of real estate sales prices to assessment officials? □ Yes, disclosure made to state/province/territory officials □ Yes, disclosure made to local assessors □ Yes, disclosure made to both □ No

**Q17: When does the sale price disclosure occur?** 
During deed recording
Other (e.g., 30 days or other statutory period)

## Appendix A. 2008 Ratio Study Practices Questionnaire (continued)

Q18: Is a method in place to track a disclosure document for every recorded sale? Yes/No

Q19: If a method is in place to track a disclosure document for every recorded sale, describe the method:

**Q20:** What type of disclosure document is used?  $\Box$  Sale price statement  $\Box$  Comprehensive questionnaire  $\Box$  Both  $\Box$  Other, describe (50 char. limit):

**Q21:** What office is responsible for initially accepting the disclosure document?  $\Box$  Recorder/registrar  $\Box$  Local assessor  $\Box$  State office  $\Box$  Other, describe (50 char. limit):

Q22: Are disclosed sale prices confidential? Yes/No Explain:

**Q23:** Is a value-related fee charged (e.g., transfer tax, deed stamp) for real property transfers?  $\Box$  No  $\Box$  Yes, provide the rate(s) (50 char. limit):

Q24: Does your jurisdiction have a law making recordation/registration mandatory for real property transfers? Yes/No  $\,$ 

**Q25:** Regarding sales price adjustments: Which of the following adjustments to sale price do you have authority to implement in your ratio studies? (check all that apply) No authority to implement adjustments Time Financing Personal property Closing costs Brokerage fees Intangible personal property Delinquent taxes Other, describe (50 char. limit):

**Q26:** Which of the following adjustments to sale price do you actually use in your ratio studies? (check all that apply)  $\Box$  Time  $\Box$  Financing  $\Box$  Personal property  $\Box$  Closing costs  $\Box$  Brokerage fees  $\Box$  Intangible personal property  $\Box$  Delinquent taxes  $\Box$  Other, describe (50 char. limit):

Q27: Are blanket or global adjustments made to sales prices prior to computing ratios? (For example, some jurisdictions adjust all prices down by 1% in an attempt to adjust for personal property that is difficult to isolate sale by sale; others might adjust all sales by 10% for financing considerations.) Yes/No

Q28: If blanket or global adjustments are made to sale prices prior to computing ratios, describe the types of adjustments and indicate the maximum percentage adjustment generally permitted by this procedure:

**Q29:** Are there any court cases in your jurisdiction affirming or disallowing these blanket or global adjustments?  $\Box$  No  $\Box$  Yes, provide citation (50 char. limit):

**Q30:** How is your ratio study used? (check all that apply)  $\Box$  To order adjustments to locally determined assessed values  $\Box$  To equalize state or provincial funding of local jurisdictions  $\Box$  To order local jurisdictions to reappraise  $\Box$  To advise provincial, state, or local jurisdictions of assessment conditions  $\Box$  To assist mass appraisal programs  $\Box$  To approve tax assessment roll  $\Box$  To adjust or equalize centrally determined assessed values (such as utilities)  $\Box$  Other, describe (50 char. limit):

Q31: Do you or another oversight agency have authority to order adjustments to, or a reappraisal of, locally determined values? Yes/No

Q32: How many local jurisdictions have been issued orders to ADJUST values in the past three years? (50 char. limit)

Q33: How many local jurisdictions have been issued orders to REAPPRAISE values in the past three years? (50 char. limit)

**Q34:** If you order adjustments to locally determined assessed or appraised values, which of the following procedures are used? (check all that apply)  $\Box$  Order local officials to apply trending factors to individual classes or categories of property  $\Box$  Trend all types of property equally, based on a jurisdiction-wide adjustment factor  $\Box$  Give local officials a compliance grace period to apply indicated factors  $\Box$  Give local officials a grace period to recalibrate mass appraisal models  $\Box$  Other, describe (50 char. limit):

Q35: Do you have an appraisal level standard that allows some variance from your statutorily required appraisal level?  $\Box$  Yes, 0.90–1.10  $\Box$  No  $\Box$  Yes, other level standard (describe variance):

**Q36:** If yes to **Q35**, is the appraisal level variance set by statute?  $\Box$  Yes  $\Box$  No  $\Box$  If no, describe (50 char. limit):

Q37: If you use your ratio study to test appraisal level compliance, are allowances made for sample reliability using statistical tests, such as confidence intervals?  $\Box$  Yes  $\Box$  No  $\Box$  Not applicable—appraisal level compliance is not tested

Q38: If you use your ratio study to test appraisal level compliance, describe the reliability tests used:

**Q39:** Check each measure of level that you calculate and indicate if it is used for direct and/or indirect equalization. 
ARITHMETIC MEAN 
Used for direct equalization; 
MEDIAN 
Used for direct equalization; 
WEIGHTED MEAN 
Used for direct equalization; 
GEOMETRIC MEAN
Used for direct equalization 
Used for indirect equalization; 
GEOMETRIC MEAN
Used for direct equalization 
Used for indirect equalization 
Ised for indirect equalization; 
Ised for direct equalization; 
Ised for indirect equalization; 
Ised for indirect equalization; 
Ised for direct equalization; 
Ised for indirect equalization; 
Ised for direct equalization; 
Ised for direct equalization; 
Ised for direct equalization; 
Ised for indirect equalization; 
Ised for direct equalization; 
Ised for indirect equalization; 
Ised for direct equalization; 
Ised for direct

Q40: Do you test the distribution of ratios to see if it is statistically normal? Yes/  $\rm No$ 

Q41: If you test the distribution of ratios to see if it is statistically normal, how does this determination affect the measure(s) of level used for testing compliance or equalization? Describe:

Q42: Have you incorporated portions of the IAAO Standard on Ratio Studies in your statutes or rules and regulations? Yes/No

Q43: When testing reliability for level of appraisal, which of the following is used to determine statistical compliance with standards for appraisal level? 
□ Point estimates □ Confidence intervals □ Both point estimates and confidence intervals

Q44: Hypothetical situation: There is a legal requirement for appraisals to fall between 90 and 110% of market value as measured by the ratio study sample median. An equalization order could be issued if the requirement is not met. A study sample has a median ratio of 85%, and has a 95% confidence interval that falls in the range of 76 to 94%. Would your agency rule this result to be in compliance with statutory appraisal level requirements? Yes, the confidence interval overlaps the threshold for compliance. No, only the point estimates are used to make inferences about compliance. No, the confidence interval fails to overlap 100%.

# Appendix A. 2008 Ratio Study Practices Questionnaire (continued)

Q45: Hypothetical (cont.): If the confidence interval overlaps the threshold for compliance and the situation (median ratio point estimate is out of compliance) continues for several years, which actions would your agency take? (check all that apply)  $\Box$  Lower the level of confidence and reevaluate  $\Box$  Base the compliance decision on point estimates  $\Box$  Continue to find the jurisdiction in compliance  $\Box$  Other

Q46: If you checked "Other" in Q45, describe here:

Q47: Hypothetical (cont.): How would your response differ if the sample COD (or other measure of uniformity) also showed very poor uniformity? (check all that apply) No influence on decisions regarding level of confidence Lower the level of confidence Use the point estimate only to evaluate level Review level measures from previous years Use additional information, such as sample size, to make a final determination about level compliance

Q48: Regarding assessment uniformity: Do you have specific standards or requirements for assessment uniformity as measured by the COD (coefficient of dispersion)? (These may be statutory or procedural, but in either case would be used to find jurisdictions in or out of compliance.) Yes/No

Q49: For improved residential property (single-family homes, condominiums, manufactured housing, 2–4 family units), if you have specific standards or requirements for assessment uniformity as measured by the COD, enter any differences from the following standards. (50 char. limit in each field) COD 10.0 or less for very large jurisdictions/densely populated/newer properties/active markets; COD 15.0 or less for large to mid-sized jurisdictions/older and newer properties/less active markets; COD 20.0 or less for rural or small jurisdictions/older properties/ depressed market areas. Some other standard/requirement, specify:

Q50: For income-producing properties (commercial, industrial, apartments), if you have specific standards or requirements for assessment uniformity as measured by the COD, enter any differences from the following standards. (50 char. limit in each field) COD 15.0 or less for very large jurisdictions/densely populated/ newer properties/active markets; COD 20.0 or less for large to mid-sized jurisdictions/slower development/less active markets; COD 25.0 or less for rural or small jurisdictions/older properties/depressed market areas. Some other standard/ requirement, specify:

Q51: For residential vacant land, if you have specific standards or requirements for assessment uniformity as measured by the COD, enter any differences from the following standards. (50 char. limit in each field) COD 15.0 or less for very large jurisdictions/rapid development/active markets; COD 20.0 or less for large to mid-sized jurisdictions/slower development/less active markets; COD 25.0 or less for rural or small jurisdictions/little development/depressed markets; Some other standard/requirement, specify:

Q52: For other vacant land (non-agricultural), if you have specific standards or requirements for assessment uniformity as measured by the COD, enter any differences from the following standards. (50 char. limit in each field) COD 20.0 or less for very large jurisdictions/rapid development/active markets; COD 25.0 or less for large to mid-sized jurisdictions/slower development/less active markets; COD 30.0 or less for rural or small jurisdictions/little development/depressed markets. Some other standard/requirement, specify:

**Q53:** If you do not use the COD, what uniformity measure is used?  $\Box$  No uniformity measure is used  $\Box$  Other, describe measure and standard (50 char. limit):

Q54: Has a lower limit on the COD been established as an indicator of possible sales chasing?  $\Box$  No  $\Box$  Yes, describe lower limit that you use (50 char. limit):

Q55: Do you have standards for price-related bias (vertical inequity) as measured by the PRD (price-related differential) or other statistical tests? Yes/No

Q56: If, in addition to or as an alternative to the PRD, you use another statistical test for price-related bias (vertical inequity), describe:

**Q57:** If you have standards for price-related bias (vertical inequity), which do you use?  $\Box$  PRD 0.98–1.03  $\Box$  Other, describe (50 char. limit):

Q58: Can your agency initiate any action as a result of assessment uniformity (e.g., COD, PRD, etc.) conditions? Yes/No

**Q59:** What actions can your agency initiate as a result of assessment uniformity conditions? (check all that apply)  $\Box$  Order a reappraisal  $\Box$  Withhold funding (e.g., revenue sharing)  $\Box$  Other

Q60: If you answered "Other" to Q59, describe what actions your agency can initiate:

**Q61:** Do you calculate reliability measures, such as confidence intervals, on uniformity statistics around the:  $\Box$  COD  $\Box$  PRD  $\Box$  Both  $\Box$  Neither

**Q62:** If you initiate action as a result of assessment uniformity conditions, what indicator is action dependent upon?  $\Box$  Point estimates  $\Box$  Confidence intervals  $\Box$  Not applicable  $\Box$  Other, describe (50 char. limit):

Q63: Are local jurisdictions required to annually value categories of property (other than agricultural or timberland) at 100% of current market value (full cash value)?  $\rm Yes/No$ 

Q64: Is property that is not required to be appraised during a given year required to have its value updated during the interim year or years? Yes/No

**Q65:** Is property appraised at a uniform base year (e.g., 2001)?  $\Box$  No  $\Box$  Yes, indicate most recent base year used (50 char. limit):

Q66: Describe property classes associated with the base year:

Q67: Describe how your appraisal and valuation update cycles work:

**Q68:** Is there a uniform fractional assessment ratio for each category of property in every local assessment jurisdiction?  $\Box$  Yes, but ratios may differ by category  $\Box$  No, they can be established by each local jurisdiction  $\Box$  Other, every category of real property is required to be at 100%

**Q69:** If there is a uniform fractional assessment ratio for each category of property, how are the rates set?  $\Box$  Statute  $\Box$  Constitution

**Q70:** For residential properties, is the required assessment ratio set at 100% of market value?  $\Box$  Yes  $\Box$  No, enter your assessment ratio (50 char. limit):

Q71: For farmland, ranchland, and timberland, is the required assessment ratio set at 100% of market value?  $\Box$  Yes  $\Box$  No, enter your ratio percentage (50 char. limit):

Q72: For commercial property, is the required assessment ratio set at 100% of market value?  $\Box$  Yes  $\Box$  No, enter your ratio percentage (50 char. limit):

# Appendix A. 2008 Ratio Study Practices Questionnaire (continued)

**Q73:** For industrial property, is the required assessment ratio set at 100% of market value?  $\Box$  Yes  $\Box$  No, enter your ratio percentage (50 char. limit):

Q74: For public utilities, is the required assessment ratio set at 100% of market value?  $\Box$  Yes  $\Box$  No, enter your ratio percentage (50 char. limit):

**Q75:** For railroads, is the required assessment ratio set at 100% of market value?  $\Box$  Yes  $\Box$  No, enter your ratio percentage (50 char. limit):

Q76: For other real property types, is the required assessment ratio set at 100% of market value?  $\rm Yes/No$ 

Q77: For personal property (chattel [tangible PP]), is the statutorily set and/or mandated (ordinance, regulations, etc.) assessment ratio 100% of market value?  $\Box$  Yes  $\Box$  No, enter your ratio percentage (50 char. limit):

**Q78:** How is farmland/ranchland assessed in relation to market value?  $\Box$  100% of productivity value or legislated value  $\Box$  100% of market value  $\Box$  Other % of productivity/legislated value (50 char. limit):

**Q79:** How is timberland assessed in relation to market value?  $\Box$  100% of productivity value or legislated value  $\Box$  100% of market value  $\Box$  Other % of productivity/ legislated value (50 char. limit):

**Q80:** Regarding sample size, what is the smallest sample you will use to evaluate any category of property?  $\Box$  Less than 5 observations  $\Box$  5 to 9 observations  $\Box$  10 to 19 observations  $\Box$  20 to 30 observations  $\Box$  More than 30 observations  $\Box$  Other, describe (50 char. limit):

Q81: Do you establish sample size quotas or goals (e.g., 3% of parcels in a category or a number based on a statistical sample size formula)? Yes/No

Q82: If you establish sample size quotas or goals, describe how they are established:

Q83: Do you identify and trim outlier ratios? Yes/No

**Q84:** If outliers are trimmed, what procedure do you use? (check all that apply)  $\Box$  1.5 \* interquartile range  $\Box$  3.0 \* interquartile range  $\Box$  Beyond 2 standard deviations  $\Box$  Fixed symmetric points (e.g., remove ratios < .50 or > 1.50)  $\Box$  Fixed asymmetric points (e.g., remove ratios < .30 or > 2.00)  $\Box$  Good judgment  $\Box$  Other, describe (50 char. limit):

Q85: Is there a limit on the maximum percentage of sales that can be trimmed out of a sample? (e.g., 20%)  $\Box$  No  $\Box$  Yes, indicate percentage (50 char. limit):

Q86: Do you attempt to determine sample representativeness? Yes/No

Q87: If you attempt to determine sample representativeness, what is your procedure? Describe:

**Q88:** Do you have statutory requirements to check for sales chasing? □ Yes □ No □ Nonstatutory requirement

Q89: Do you test for sales chasing? Yes/No

**Q90:** If you test for sales chasing, what techniques do you use? (check all that apply in order of use: 1 = Not used; 2 = First choice ... 7= Sixth choice) Comparison of average value changes; Comparison of average unit values; Split sample technique; Comparison of observed vs. expected distribution of ratios; Mass appraisal techniques; Other

Q91: If you test for sales chasing and you said "Other" for techniques used, describe the technique(s):

Q92: Can a taxing district or third party initiate legal action as a result of your ratio study? Yes/No

Q93: Are business or commercial machinery and equipment considered taxable personal property? Yes/No  $\,$ 

Q94: If business or commercial machinery and equipment are considered taxable personal property, is a ratio study conducted for this personal property? Yes/No  $\gamma$ 

**Q95:** If a ratio study is conducted for commercial machinery and equipment, which of the following does the study use?  $\Box$  Sales only  $\Box$  Appraisals only  $\Box$  Both sales and appraisals

Q96: If you use both sales and appraisals for your personal property ratio study, do you combine them in studying one type or category (e.g., vehicles, machinery) of property? Yes/No

**Q97:** If you use appraisals for your personal property ratio study, what appraisal technique(s) do you use? (check all that apply)  $\Box$  Depreciation or economic life tables  $\Box$  Iowa curves  $\Box$  Other

Q98: If you use other personal property ratio study appraisal techniques, list the techniques:

Q99: Describe how the results of your personal property ratio study are used:

Q100: Do you have a statutory exemption for intangible personal property?  $\mathrm{Yes/No}$ 

**Q101:** If you have a statutory exemption for intangible personal property, which types of property would receive this exemption? (check all that apply) □ Capital stock □ Bonds □ Deposits □ Contracts and contract rights □ Copyrights □ Goodwill □ Customer lists □ Custom computer programs □ Licenses □ Patents □ Rightsof-way □ Trademarks □ Trade secrets □ Other, specify (50 char. limit):

Q102: Please provide comments about your ratio study practices that were not covered by this survey:

Q103: Please share any comments you may have about this survey:

Q104: Your time and expertise in completing this survey are greatly appreciated and the IAAO Technical Standards Committee thanks you. Would you like a copy (Adobe Acrobat PDF format) of the final report sent to your e-mail address? Yes  $\square$  No  $\square$  Enter alternate e-mail address here if preferred:

	= These questions are new to that year's survey													
	= Question	n was not as	ked on surve	ey or responses were not tabui	lated in those years									

Notes

(a) Two Hawaiian respondents were counted once in some instances and twice in others where applicable.

(b) Includes District of Columbia and the two Hawaiian local respondents; does not include local respondent from Delaware which does not conduct ratio studies

(c) For U.S., the contracted totals are also included in the state count.

- (d) The 2008 total reflects addition of Delaware and loss of disclosure in South Carolina and the corrected classification for Nevada. The U.S. total for 1997 was revised to reflect an error in tabulating Oregon's response, which should have been counted as a "Yes." The U.S. total for 2003 includes the addition of Pennsylvania and, effective July 2003, New Mexico.
- (e) Allowable variance: Not shown are responses to the 1992 survey, which total 19 "No" U.S. answers to this portion of the question.
- (f)  $A \pm 5\%$  variance: Not shown are responses to the 1985 survey, which totaled 7 U.S. responses to this portion of the question.
- (g) 2003 Question 16, Assessments = 100% of MV: U.S. responses were edited so that "Yes" count reflects only those jurisdictions whose assessment level equals 100% of current (2002 or 2003) market value for all residential properties.
- (h) Question 18, Sales chasing: The 1997 responses to this question were not compiled for either U.S. or Canada.
- (i) See appendix E for most popular choices of sales-chasing techniques.

Province/ Territory	How many local jurisdictions have been issued orders to adjust values in the past three years?	How many local jurisdictions have been issued orders to reappraise values in the past three years?	What is your appraisal level standard?	Do you have an appraisal level standard that allows some variance from your statutorily required appraisal level?	If yes, is the appraisal level variance set by statute?	Are allowances made for sample reliability using statistical tests, such as confidence intervals?
AB	0	0	0.95-1.05	yes	yes	no
BC	0	0	0.90-1.10	yes	yes	yes
MB	0	0	0.90-1.10	yes	yes	yes
